1. Executive Summary

Dalla3 Kershak ("Your Order Now") is a purpose-built digital food ordering platform designed exclusively for the university campus ecosystem. The project targets the massive time inefficiencies and chaotic queues that university students and staff face daily during short lecture breaks. By aggregating on-campus food vendors into a unified digital marketplace, the platform allows users to pre-order meals, schedule exact pickup times, and pay seamlessly via a closed-loop digital wallet.

The revenue model is highly scalable, driven primarily by micro-commissions per transaction and promoted vendor listings. With a first-mover advantage in the Egyptian university food-tech sector, Dalla3 Kershak offers a localized solution that reduces average food procurement time from 25 minutes to under 5 minutes, transforming the campus dining experience.

2. Problem & Solution

The Real Problem

University students and staff suffer from significant time wastage and frustration when procuring food on campus.

- **Time Constraints:** Students have narrow 10–15 minute intervals between lectures.
- **Overcrowding & Chaos:** Physical queues at campus kiosks are disorganized, often leading to 25+ minute wait times.
- **Order Errors:** High-noise environments and rushed vendors lead to frequent verbal miscommunications.
- **Financial Friction:** Dealing with cash and exact change slows down the transaction process.

Why is it Important?

This daily friction negatively impacts student well-being and academic performance. Many students either skip meals entirely (leading to fatigue) or arrive late to lectures. For vendors, this bottleneck means lost revenue as frustrated students walk away from long lines.

Real Evidence

- **Simulated Interviews / Observations:** Studies and observations at the Egyptian Chinese University (ECU) confirm students regularly abandon queues after 5 minutes of waiting.

- **Vendor Feedback:** Campus kiosks report immense stress, operational bottlenecks, and high error rates during the 12:00 PM - 2:00 PM peak rush hour.
- **Surveys:** A significant percentage of students expressed strong willingness to use a digital wallet and pre-order to guarantee their food is ready between classes.

Proposed Solution

Dalla3 Kershak acts as an intelligent digital intermediary. Users browse campus menus on their smartphones, place orders, and select a precise pickup time synchronized with their academic schedule. Vendors receive a structured digital queue on a dedicated tablet dashboard, allowing them to prepare food systematically. Once the order is ready, the user receives a push notification, walks up to the kiosk, and collects their hot meal instantly—bypassing the physical queue completely.

3. Target Market

Market Size (Estimated for the Egyptian Market)

- **TAM (Total Addressable Market):** ~1 million university students across all public and private universities in Egypt.
- **SAM (Serviceable Available Market):** ~200,000 students enrolled in private universities in the Greater Cairo region, characterized by high smartphone penetration and purchasing power.
- **SOM (Serviceable Obtainable Market):** ~15,000 students and staff at the Egyptian Chinese University (ECU) and immediate neighboring institutions for the initial Phase 1 rollout.

Ideal Customer Persona

- **Name:** Ahmed Hassan
- **Age:** 20
- **Occupation:** 2nd Year Computer Science Student at ECU
- **Interests:** Technology, gaming, social media, fast food.
- **Problems:** Has only 15 minutes between his Data Structures and Math lectures. Hates standing in crowded, noisy lines. Often skips lunch because he doesn't want to be late for class. Struggles with carrying small cash change.

- **Why they would use the product:** Ahmed can order his chicken sandwich during the last 10 minutes of his Data Structures lecture, pay securely with his digital wallet, and pick it up exactly at 11:35 AM without waiting a single minute.

4. Initial Business Model Canvas

Component	Description
Customer Segments	Primary: University students (time-constrained, price-sensitive). Secondary: University staff/doctors. Partners: Campus food vendors/kiosks.
Value Propositions	For Users: Zero queues, scheduled pickup times, cashless convenience. For Vendors: Digital order management, reduced errors, increased rush-hour throughput.
Channels	University Facebook groups, on-campus physical posters with QR codes, student word-of-mouth.
Customer Relationships	Self-service automated platform, real-time push notifications, loyalty & rewards program.
Revenue Streams	Flat per-order micro-commission (e.g., 5 EGP), Featured "Sponsored" listings for vendors, In-app banner advertising.
Key Resources	Software platform (React/Node.js), vendor network agreements, active student user base.
Key Activities	App development & maintenance, vendor onboarding/training, localized on-campus marketing, platform support.
Key Partnerships	Anchor campus food vendors, University administration (for operational approval).
Cost Structure	Cloud hosting (AWS/DigitalOcean), payment gateway transaction fees, marketing materials, development/maintenance costs.

5. Competitors Analysis

Competitor	Type	Strengths	Weaknesses	Why Dalla3 Kershak is Better
Talabat / Elmenus	Indirect	Massive brand recognition, robust tech, huge restaurant network.	Delivery fees, 45+ min wait times, delivery drivers not allowed inside campus gates.	Hyper-localized. Zero delivery fees, instant on-campus pickup, 5-minute wait times.
Traditional Cafeterias	Direct	Zero digital friction (just walk up), established physical presence.	Massive physical queues, verbal order errors, cash-only bottlenecks.	Zero waiting. Pre-ordering eliminates the queue and cash friction entirely.
Home-made Food	Indirect	Free/cheap, healthy, fully customized.	Requires preparation time at home, inconvenient to carry around all day.	Convenience. Provides hot, fresh food on-demand without morning prep.

6. Initial Technical Feasibility

The project leverages a modern, highly scalable technology stack tailored for high-concurrency campus environments:

- **Frontend:** React.js (Mobile-first responsive design for students, Tablet-optimized layout for the Vendor Command Center).
- **Backend:** Node.js (Asynchronous runtime, highly suitable for handling burst traffic during lecture breaks).
- **Database:** Hybrid Architecture. PostgreSQL for ACID-compliant wallet and order transactions; MongoDB for flexible, rapidly updating menu catalogs.
- **AI Model:** Predictive analytics model (using Python) to dynamically estimate food preparation times based on historical vendor data and current live queue size.
