

# University Food Ordering Application

## Introduction

The idea of this project is to develop a mobile application that connects all university cafeterias and restaurants in one platform. Students will be able to order food and drinks from any place on campus while attending lectures or sitting anywhere, without wasting time waiting in lines.

## 1. Potential Monopoly Angle

Our application has a strong potential monopoly angle because we are the first movers in this market inside the university. Currently, there is no unified platform that connects all campus cafeterias and restaurants together. This gives us a significant advantage, as we can establish ourselves before any competitors enter the market.

In addition, our application will be:

- 1 **Easy to use:** A simple and user-friendly interface that any student can navigate.
- 2 **Well-designed (clean and modern):** Making the experience attractive and smooth.
- 3 **Secure:** Ensuring safe transactions and protecting user data.

Because of these factors, students will naturally prefer our application as their default way of ordering food, which strengthens our monopoly position.

## 2. Hedgehog Concept

### *Passion*

Our main passion is achieving financial success and building a profitable project. At the same time, we are motivated by solving a real problem students face daily, which is wasting time between lectures to get food or drinks.

This application will save a lot of time. For example, instead of leaving a lecture to buy food, a student can order during the lecture and pick it up immediately after it ends, allowing them to attend the next lecture without delay.

### *Best At*

- 1 Building the application efficiently
- 2 Designing a smooth and simple user experience
- 3 Maintaining strong security to protect user data and transactions

## ***Economic Engine***

Our business model is simple and scalable. We will generate revenue by taking a small commission (5 EGP) on every order.

For example:

- 1 If a student orders food worth 95 EGP
- 2 They will pay 100 EGP through the application
- 3 We keep 5 EGP as commission and transfer the remaining 95 EGP to the restaurant

This model ensures continuous revenue with every order and scalability as the number of users increases.

## **3. Three Brutal Facts We Must Face**

### ***1. Convincing Restaurants and Customers***

One of the biggest challenges is convincing cafeterias and restaurants to join our platform. At the same time, we need to convince students to change their habits and start using the application instead of ordering directly.

### ***2. Lack of Experience***

We currently do not have enough experience in managing a real business or running a startup. This may lead to mistakes in decision-making, operations, or scaling the project.

### ***3. Lack of Funding***

We do not have sufficient funding to support development, marketing, and operations. This could slow down our progress and limit our ability to grow quickly.

## **Conclusion**

This project has strong potential because it solves a real problem and offers a convenient solution for students. By focusing on building a simple, secure, and efficient application, we can create a strong position in the market. However, success will depend on overcoming challenges such as gaining user trust, improving our experience, and securing funding.
